

# Web Site Design Work Log

TSA

2015-2016

To make the website, we first found the service Weebly to find an accessible way to create a website. We found the prompt (renewable power sources) and we proceeded to research it.

We divided up our categories and started working. The categories were solar power, wind power, and water power. We found out how each of them works, some pros and cons, some possible ways to integrate renewable power, and started on the typing.

Now, we added in the graphics and made sure they fit nicely for the size of the image we needed.

Then, we filmed the video interviews, edited them, and put them in the website.

After that we added in our resources and check the grammar and finished the website.
